

Document Extract & CoWork

AI-Powered Intelligence Over Specialty Insurance Documents

The Opportunity

Specialty insurance organizations hold their most critical business intelligence locked inside ImageRight — hundreds of thousands of submissions, policy forms, coverage opinions, claims files, and broker correspondence. Today, this content is **invisible to AI and analytics**. Finding a document requires knowing exactly where it lives. Answering *“What exclusions apply to this claim?”* means manually opening files and reading them.

The result: underwriters spend 30–40% of their time on document search. Claims examiners review entire files for a single policy term. Leadership has no real-time view of portfolio metrics.

The Solution

Document Extract & CoWork transforms ImageRight’s document corpus into a conversational intelligence layer — enabling any authorized user to ask questions in plain English and get accurate, cited answers in seconds.

What Users Ask	What the System Does
“Find the D&O submission for Acme Holdings”	Semantic search across all source folders and formats
“What exclusions apply to claim CLM-2024-5521?”	Retrieves and surfaces relevant policy language
“Total reserves across open D&O claims?”	Aggregates extracted data from thousands of documents
“Which surplus lines filings are missing for Q3?”	Gap analysis without manual counting
<i>Any question not listed here</i>	Handled dynamically — not predefined

Key differentiator: Questions are not predefined. The system handles novel questions through semantic search (Cortex Search) and AI-generated SQL (Cortex Analyst), routed by a Cortex Agent. No IT tickets. No report requests. No waiting.

How It Works

Documents flow automatically from ImageRight via REST API into Snowflake, where a fully managed pipeline processes them:

- **Extract** — AI_PARSE_DOCUMENT converts TIFF scans, digital PDFs, Word files, and images into structured text
- **Classify** — AI_CLASSIFY categorizes into 50+ specialty types: submissions, endorsements, coverage opinions, FNOL, reinsurance certificates, surplus lines filings
- **Extract Attributes** — AI_EXTRACT pulls key fields: policy limits, SIRs, retroactive dates, coverage form, insured names, loss dates, reserve amounts
- **Index & Serve** — Cortex Search (semantic retrieval) + Cortex Analyst (natural language analytics) + Cortex Agent (intelligent routing)

100% Snowflake-native. No third-party AI services. No data leaves your environment.

Built for Specialty Insurance

Purpose-built for E&S and specialty lines — D&O, E&O, Cyber, EPL, Environmental, Professional Liability, Excess/Umbrella, Marine, Aviation, Surety, Facultative Reinsurance. The system understands claims-made triggers, retroactive dates, SIRs, manuscript policy language, Lloyd's syndicate structures, and wholesale distribution.

Business Value

Claims (Primary Focus)

Claims Workflow	Before	After
Find coverage opinion for a claim	Navigate ImageRight folders manually	"What coverage opinions exist for claim CLM-2024-5521?" — seconds
Identify applicable exclusions	Read full policy form, page by page	

Claims Workflow	Before	After
		AI surfaces the exact exclusion clause with policy citation
Reserve analysis across open claims	Pull files individually, build spreadsheet	“Total D&O reserves by examiner?” — real-time aggregation
Determine claims-made trigger	Open policy, locate coverage form and retro date	Retro date and coverage form extracted and queryable
Find prior similar claims	Manual search or institutional memory	Semantic search: “claims with attorney involvement and pollution exclusion”
Coverage dispute research	Research team reads 50+ page policy + endorsements	Agent retrieves all relevant coverage language in one query
New examiner onboarding	Weeks learning IR structure and file locations	Ask questions about any claim from day one

Underwriting — “Show me all D&O submissions with loss ratios above 80%” · “Which accounts are renewing in 60 days with open claims?” · “Find submissions mentioning SPAC or IPO exposure” · Faster triage, better risk selection

Wholesale Brokers / Distribution — “Compare limits and retentions across our cyber tower placements” · “Find manuscript endorsements we’ve used for tech E&O” · “Which accounts are missing surplus lines filings?” · Faster placement, compliance visibility

Operations / Leadership — “Submissions by line of business month over month?” · “Average time from FNOL to coverage opinion across D&O claims?” · Portfolio-level intelligence without BI tooling or IT requests

Compliance / Legal — “Surplus lines tax filings missing for Q3?” · “All policies expiring next 90 days with active claims?” · “Claims where notice of circumstance was filed?” · Automated gap detection

Investment & Risk

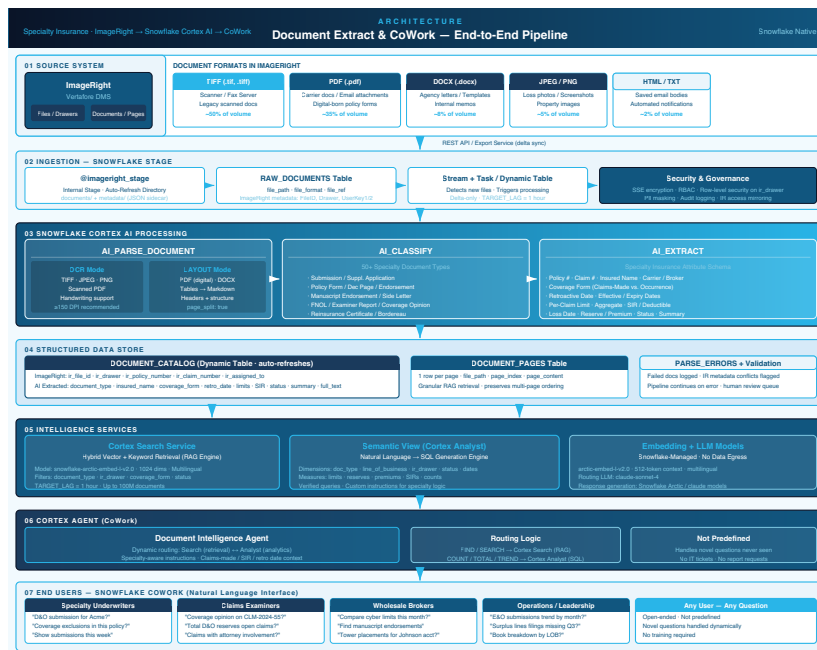

Costs scale with volume — pay per page processed, per document classified, per GB/month indexed. No upfront infrastructure. No fixed seats.

Digital PDFs (~35% of volume) skip OCR entirely — lower cost, higher accuracy.

Risk is low — ImageRight remains the system of record. This pipeline adds intelligence on top, never modifying source data.
